Let G = (V, E) be an undirected connected graph.

- ▶ A subset  $S \subseteq V$  is an independent set if  $\forall u, v \in S$  there is no edge  $(u, v) \in E$ .
- ► Independent sets have also been called internally stable sets.

Let G = (V, E) be an undirected connected graph, and S an independent set of G

- ▶ We say that the subset  $S \subseteq V$  is a maximal independent set if there is no other independent set A in which  $S \subset A$ ;
- ► The number of internal stability  $\beta(G)$  is equal to the cardinality of the largest maximal independent set.

As S is an independent set of G, then S is a clique in the complement graph.

Let G = (V, E) be an undirected connected graph, and S an independent set of G

- ▶ We say that the subset  $S \subseteq V$  is a maximal independent set if there is no other independent set A in which  $S \subset A$ ;
- ► The number of internal stability  $\beta(G)$  is equal to the cardinality of the largest maximal independent set.

As S is an independent set of G, then S is a clique in the complement graph.

Let G = (V, E) be an undirected connected graph. Design a method for computing an independent set of G

#### Algorithm: A method for computing an independent set

```
input : A graph G = (V, E).
  output: A independent set S
1 S = \emptyset:
2 while V \neq \emptyset do
u = \text{vertex with the smallest degree in G};
4 | V = V - \{u\} - \Gamma(u);
5 S = S \cup \{u\};
6 end
7 return S;
```

#### **Dominating sets**

Let G = (V, E) be an undirected connected graph.

- ▶ A subset  $S \subseteq V$  is an dominating set if  $\forall u \in S$  there exist a  $v \in V S$  such that  $(u, v) \in E$ .
- ► Dominating sets have also been called externally stable sets.

Let G = (V, E) be an undirected connected graph, and S a dominating set of G

- ▶ We say that the subset  $S \subseteq V$  is a minimal dominating set if there is no other dominating set A in which  $A \subset S$ ;
- ► The number of external stability  $\beta(G)$  is equal to the cardinality of the smallest minimal dominating set.

Let G = (V, E) be an undirected connected graph. Design a method for computing a dominance set of G

```
Algorithm: A method for computing a dominating set
   input : A graph G = (V, E).
   output: A dominating set D
 1 D = \emptyset:
 2 while V \neq \emptyset do
 u = \text{vertex with the highest degree in G};
 4 | V = V - \{u\} - \Gamma(u);
 5 | D = D \cup \{u\};
 6 end
 7 return D;
```

— Vertex cover —

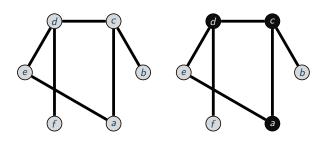

Silvio Jamil F. Guimarães

Graduate Program in Informatics – PPGINF Image and Multimedia Data Science Laboratory – IMScience Pontifical Catholic University of Minas Gerais - PUC Minas

#### Vertex cover

Let G = (V, E) be an undirected connected graph.

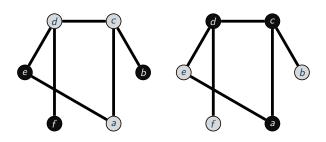

▶ A subset  $S \subseteq V$  is an vertex cover if  $\forall (u, v) \in E$ , either  $u \in S$  or  $v \in S$ .

#### Vertex cover

Let G = (V, E) be an undirected connected graph, and S a vertex cover of G

As S is a vertex cover of G, then V-S is an independent set.

#### Vertex cover

Let G = (V, E) be an undirected connected graph. Design a method for computing a vertex cover in G

```
Algorithm: A method for computing a minimum vertex cover input: A graph G = (V, E). output: A independent set S

1 S = \emptyset;
2 while E \neq \emptyset do
3 | Let (u, v) an arbitrary edge of E;
4 | Choose either u or v to be included to C;
5 | S = S \cup \{u\} for instance;
6 | V = V - u;
7 end
8 return S;
```
